

The Challenge:

How to protect & manage the logic within your manufacturing systems & automation

The Solution: Link2Logic

- ✓ Use a web-based software application which gives manufacturers accountability & change management for diverse types and models of industrial equipment and devices
- ✓ Accommodate an open, distributed manufacturing system with hundreds of connected devices
- ✓ Completely & easily manage, automate & monitor back-ups of device programs & logic
- ✓ Simple, graphical user interface with valuable system reporting & device data
- ✓ Immediate email notification, customizable to your individual requirements

Scalable access, monitoring & logic management for up to 1000 different devices on your floor

“One Click” recovery of automation programs in the case of power loss or program corruption

Web-based application with ease of navigation & customized email notifications

Link2Logic is a web-based application, accessible via most Internet browsers with a user name & password authentication process. It connects directly & continuously to the devices on your plant floor, providing ongoing monitoring & feedback of device status.

Link2Logic is a powerful tool for manufacturers, providing complete control & traceability at the device level for the logic and programs associated to each device. With pre-defined backup schedules, complete history & other custom reports.

Licensing is simple too – purchase the cost effective, management module and add on the number of devices you will need to access. Expand the number of devices as required to support up to 1000 devices from a single management module. Contact us today for access to a free Link2Logic demonstration.
